

The Importance of Impact Evaluation

Ilf Bencheikh
Deputy Director / J-PAL Europe

Milan, October 2015

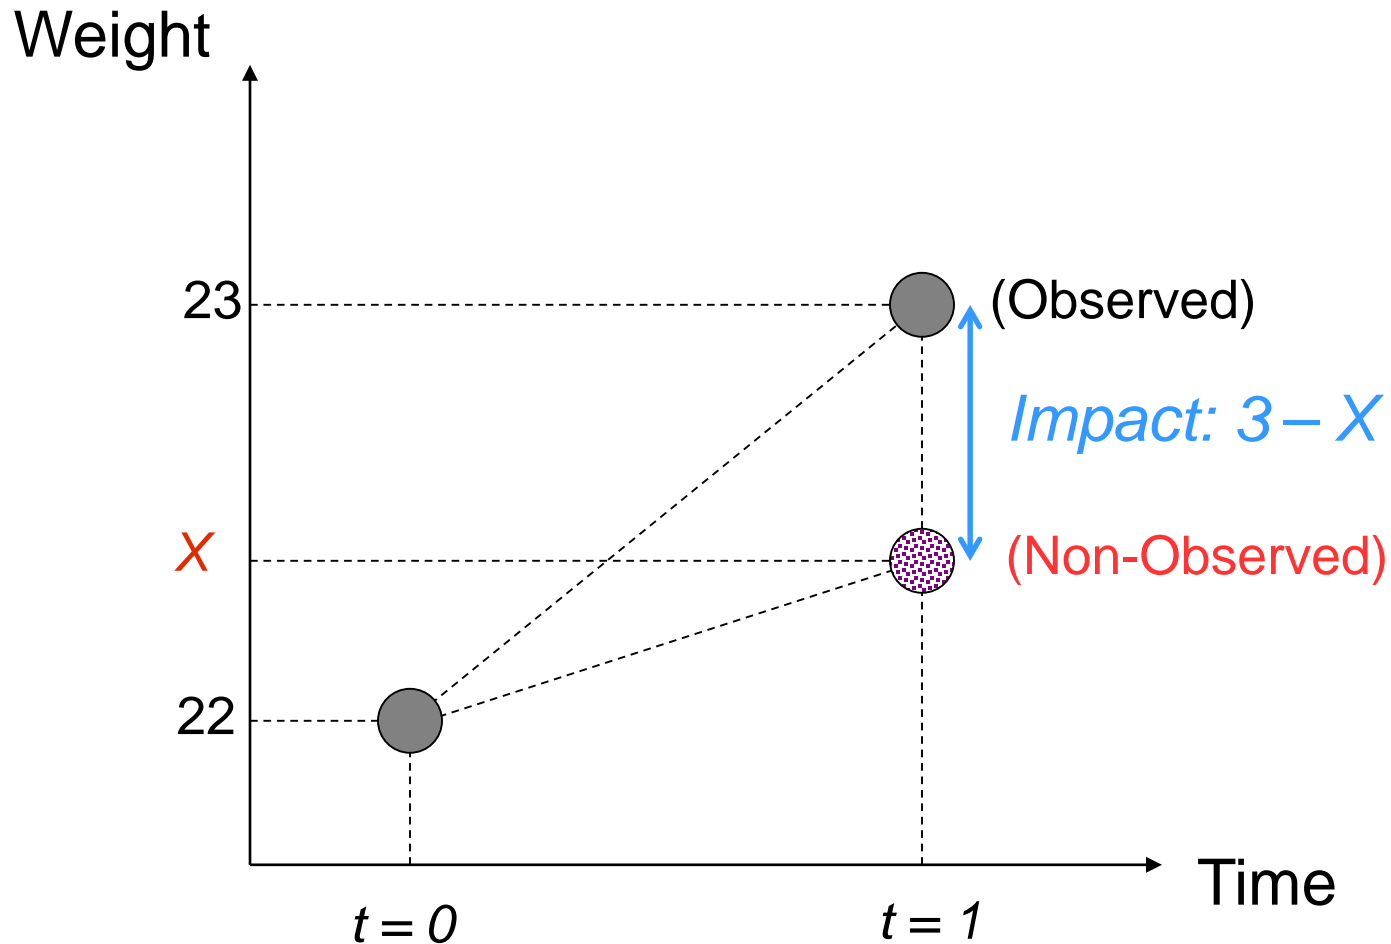

WHY EVALUATE?

The need for evaluation

- A huge need for anti-poverty programs and social policies all around the world
- Different kinds of institutions and people engaged
- Little hard evidence on key questions
- Evidence is important for maximizing the impact of limited resources

=> Importance of impact evaluation

The difficulty of measuring impact

What is impact?

- Impact is the difference between
 - what happened (with the program)
 - what would have happened (without the program)

= IMPACT of the program

Biased methods...

- Most of the time, people « evaluate » impact using:
 - Pre-post analysis (before vs. after)
 - Simple difference (beneficiaries vs. non beneficiaries)

=> Huge risk of bias!

A variety of methods

I. Quasi-experimental and non-experimental methods

- Regression Discontinuity Design
- Difference-in-Difference
- Statistical Matching
- Multivariate Regression

II. Experimental methods

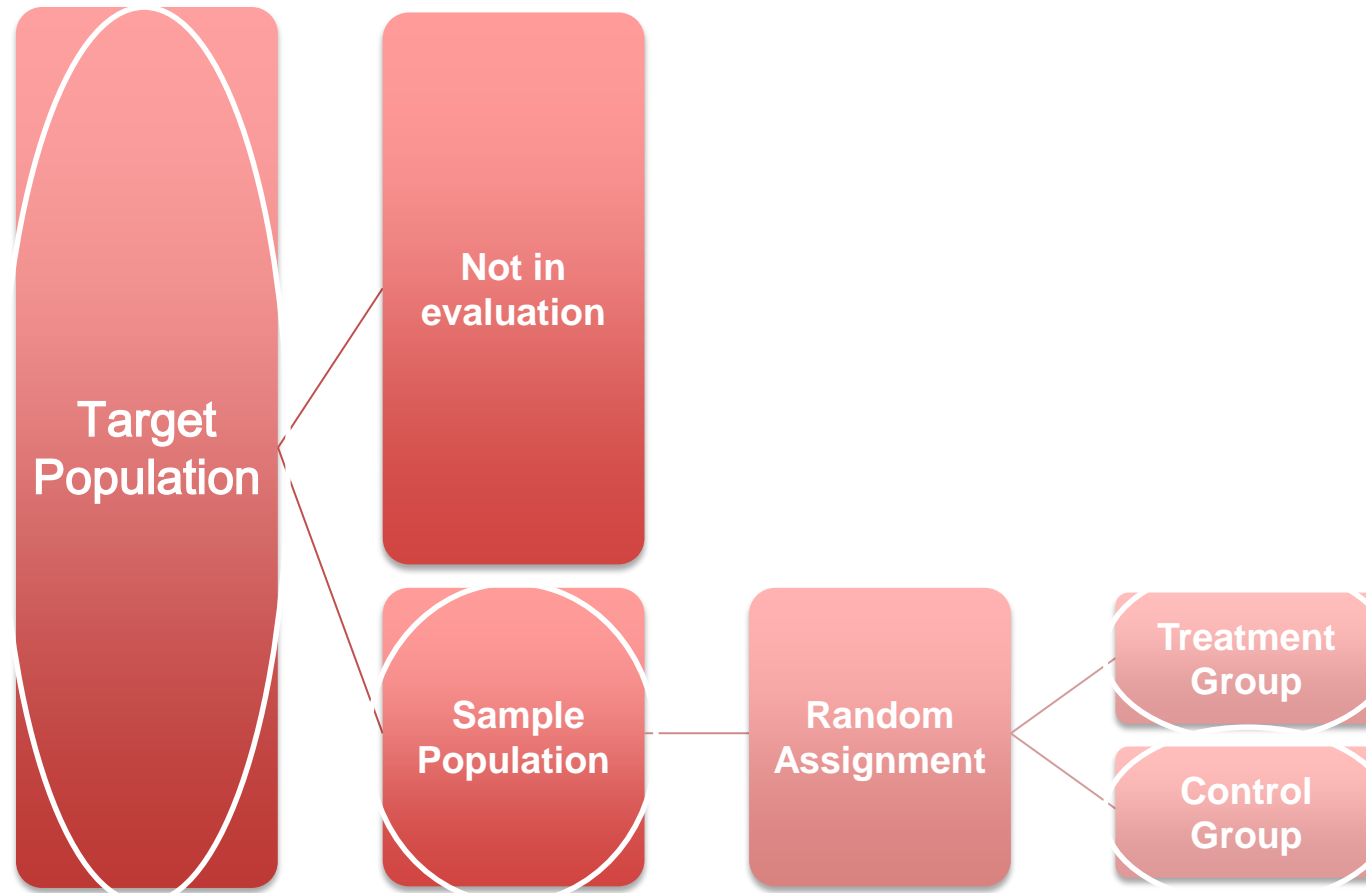

- Randomized Evaluations

Randomized evaluations

- Also known as:
 - Random Assignment Studies
 - Randomized Field Trials
 - Social Experiments
 - Randomized Controlled Trials (RCTs)
 - Randomized Controlled Experiments

WHY RANDOMIZE?

Basic set-up of a randomized evaluation

Based on Orr (1999)

Civil Society
Participant

Sample population

Random assignment in 2 groups

Revenues per person,
per month, in rupees

6457

6442

5000

2500

0

Treat.

Control

Non random assignment

Revenues per person,
per month, in rupees

6457

5000

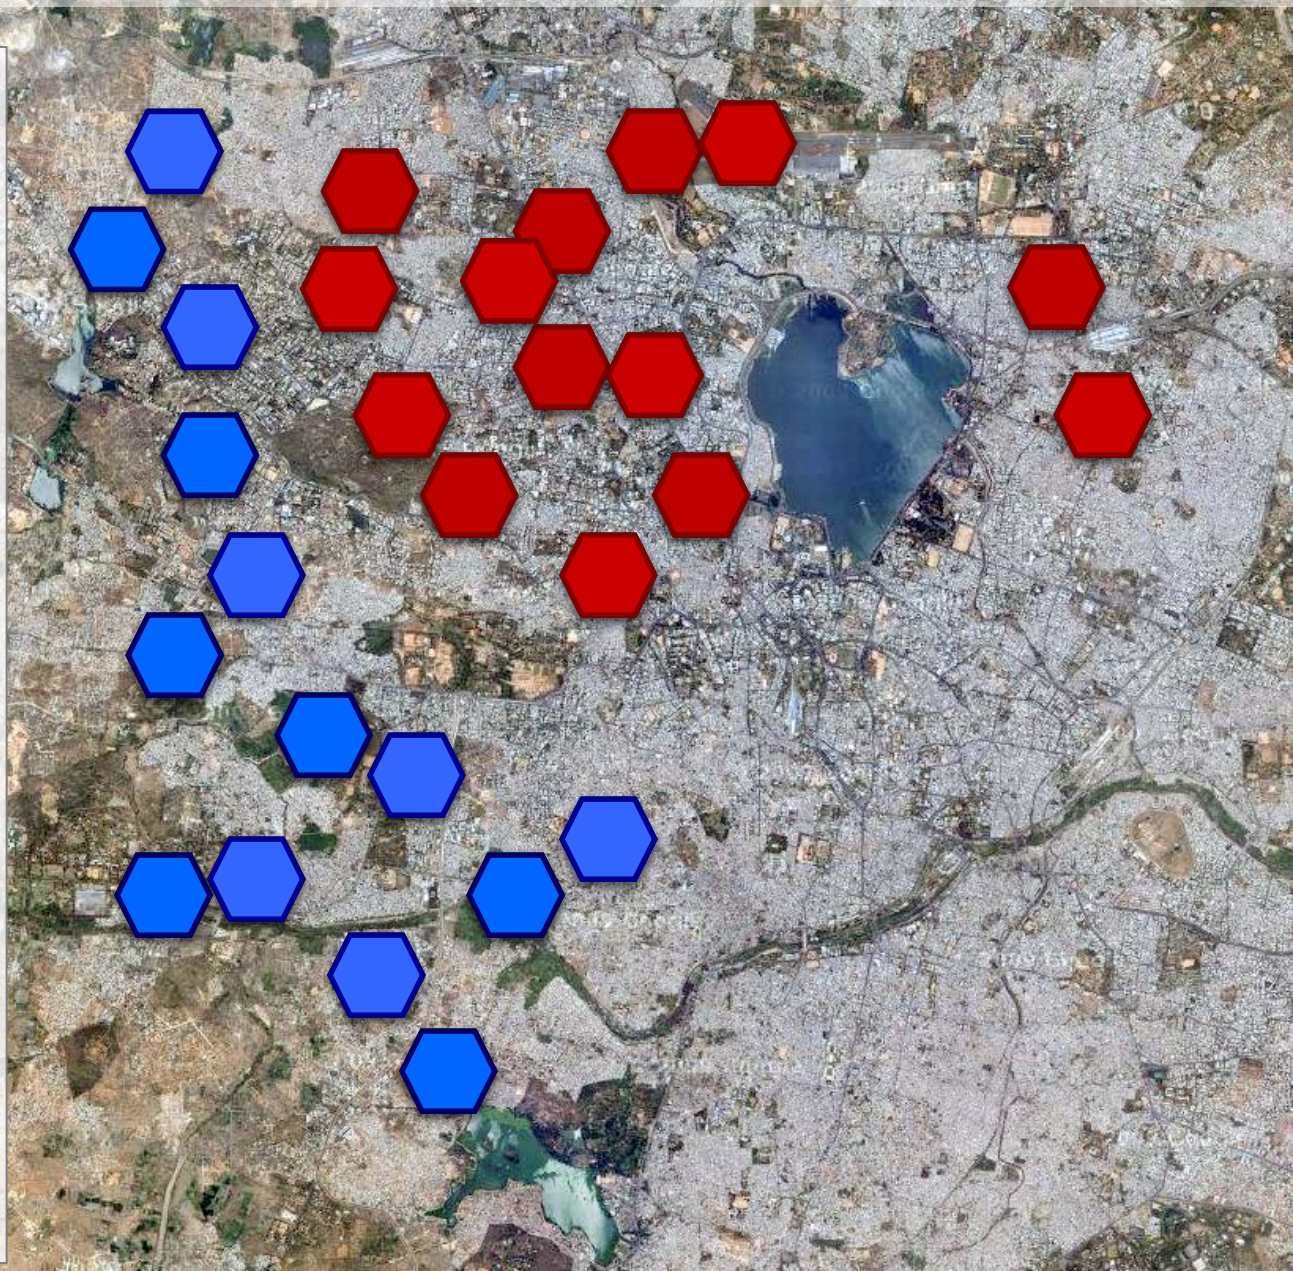

4947

2500

0

Treat.

Control

Random assignment

- This method works because of the law of large numbers
- Both groups (treatment and control) have the same characteristics, except for the program
- Differences in the outcomes can confidently be attributed to the program

REs: a long history in social sciences

- Experimental psychology (late 19th century)
- Education (early 20th century)
- Experimental sociology (early 20th century)
- From the mid 60's: huge and sharp increase of randomized evaluations in the U.S (subsidized work, income maintenance, job search counseling)
- Since mid 1990s, rapid surge in experiments in developing countries (J-PAL)

WHY J-PAL?

J-PAL: Abdul Latif Jameel Poverty Action Lab

- A network of 127 researchers at universities around the world
- Founded in 2003 by Esther Duflo and Abhijit Banerjee, MIT Professors of Economics
- Focused on randomized evaluations to improve the effectiveness of anti-poverty programs and policies

J-PAL Evaluations

- 680 randomized evaluations in 66 countries

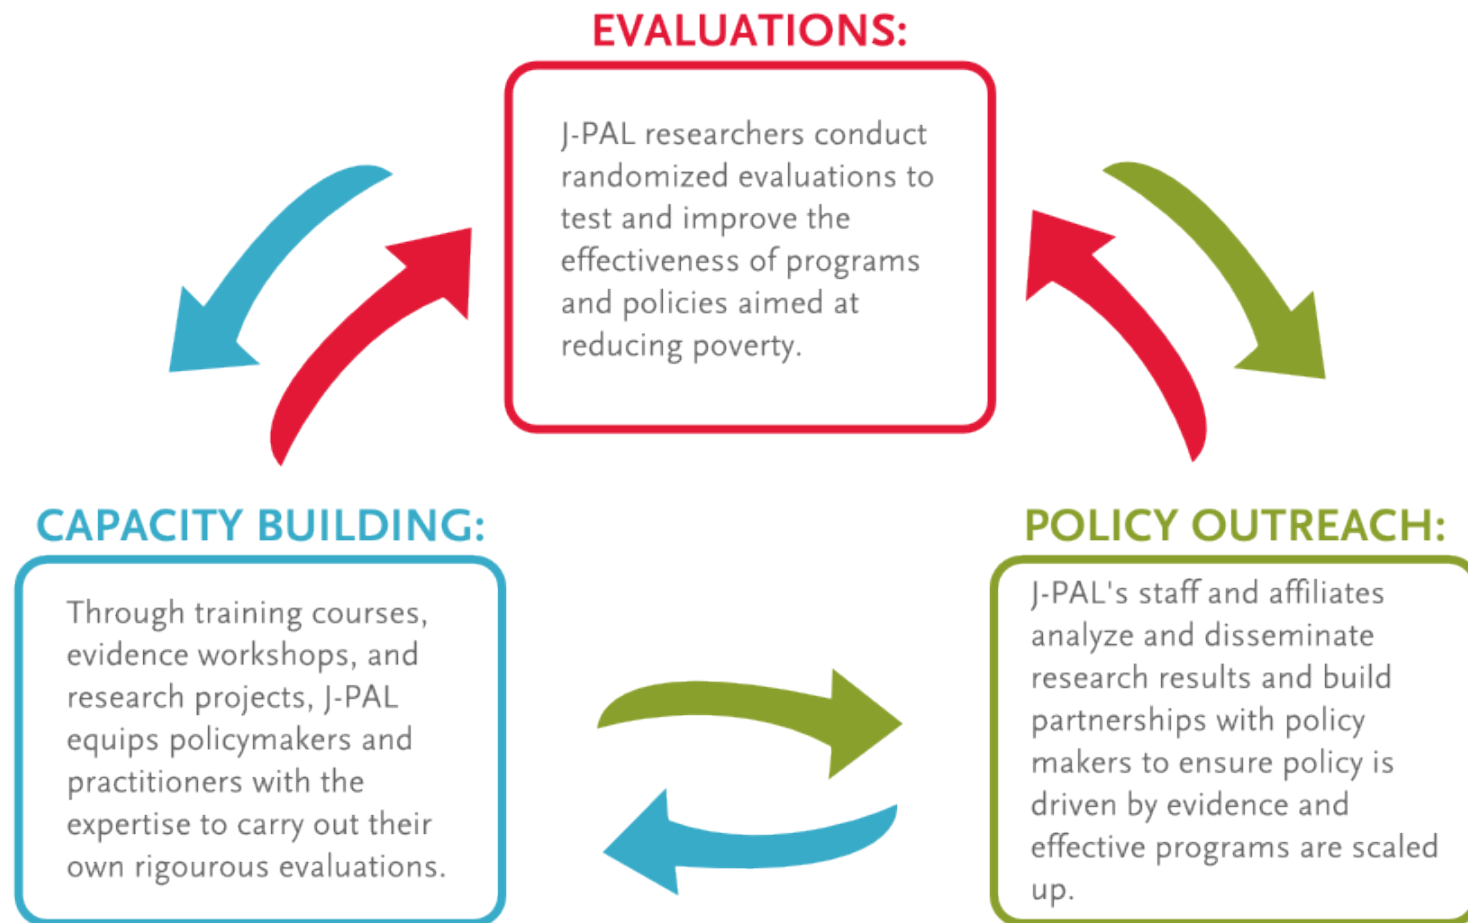

J-PAL Today: 7 offices

J-PAL'S MISSION IS TO ENSURE THAT POLICY IS DRIVEN BY EVIDENCE AND RESEARCH IS TRANSLATED INTO ACTION

RESULTS IN NUTRITION

1. Anemia and school participation

- **Question:** what does better nutrition change?
- Study in Delhi, India
- 2001-2002
- Partner: Pratham
- Bobonis, Miguel, Charu

Results

Package of iron, vitamin A and deworming drugs to children, aged 2-6 years old, at preschool:

- Impact on weight: + 0,5 kg on average *relative to comparison schools*
- Impact on school attendance: increase participation from 70% to 76% (= one fifth reduction of absenteeism)

The devil is in the details...

- Good intentions are not enough...
- The way programs are implemented on the ground matters tremendously
- Very important to understand how people *really* behave and react

2. Food subsidies and nutrition

- **Question:** Does subsidizing staple food improve nutrition?
- Study in Hunan, China
- 2006-2007
- Partner: Hunan province
- Jensen & Miller

Results

Vouchers entitling people to a price reduction on rice (between 10% and 25% of the price):

⇒ Negative effect! Shift to better-tasting food (seafood), which is less nutritious

3. Incentives for anemia reduction

- **Question:** how to convince school principals to fight against anemia?
- Study in Northwest China
- 2009-2010
- Partner: 3ie
- Miller and al.

Results

Three interventions:

- Information campaign
- Information + Subsidies
- Information + Subsidies + Incentives

⇒ Only the latter had an impact, except for schools with pre-existing incentives for educational performance.

⇒ Follow-up study on different incentives schemes

CONCLUSIONS

Building knowledge

These three examples illustrate the usefulness of randomized evaluations. They help to:

- Answer key questions
- Understand how people *really* behave
- Shape better policies and programs

=> Long way to go, need for a partnership between researchers, policy-makers, practitioners, and funders
